

Award-Winning Safety Innovation

MEC's Proactive Platform Safety System® (PPSS)

You asked for safer lifting, and MEC delivered

Introducing a multi-faceted approach to mitigate the hazards of work platform collision and entrapment.

Simply enable the trigger when elevating the platform and the device will begin sensing for possible overhead obstructions. This system does not take the place of operator

attentiveness but it is an added safety check for safer lifting. The PPSS may also be overridden by the operator.

Once the MEC PPSS device senses an object overhead, it activates an audible, intermittent alarm. The closer the object becomes, the quicker the alarm. When the object

reaches the Stop Threshold, functions that elevate the boom platform are disabled.

Simple and safe. Another great innovation from MEC Aerial Work Platforms. Talk to your MEC sales person to learn more about adding quality scissor lifts and booms to your fleet.
